

Hospital management system database design and implementation introduction

Introduction:

The Hospital Management System database was developed to help manage hospital operations such as patient records, doctor assignments, appointments, admissions, treatments, prescriptions, billing and room allocation.

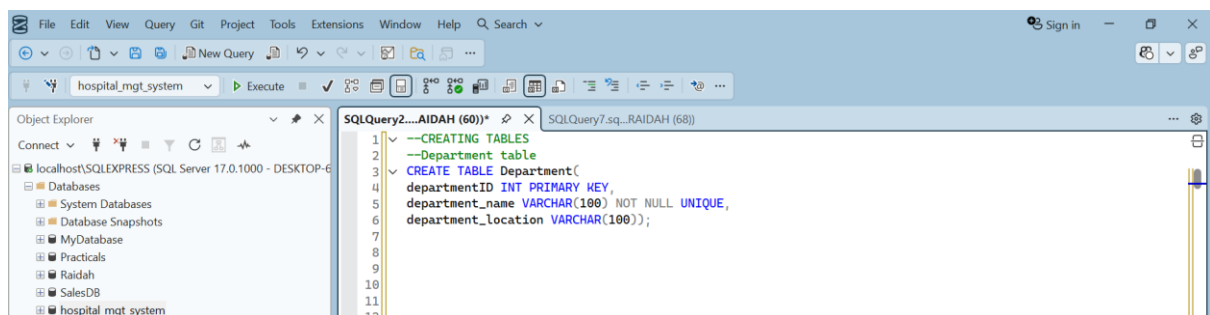

The system was implemented using Microsoft SQL server and relational database concepts including primary keys Constraints Joins and views

Objectives

- ✓ To create a relational database for a hospital
- ✓ To implement related tables using primary and foreign keys
- ✓ To insert realistic hospital data into that database
- ✓ To perform SQL queries for retrieving and managing information
- ✓ To implement an advanced database feature e.g. View

Database creation

I created a new database and named it 'hospital_mgt_system'.

Tables created:

Table Name	Purpose
Department	Stores hospital departments
Doctor	Stores doctor details
Nurse	Stores nurse information
Patient	Stores patient records
Appointment	Stores appointment information
Admission	Stores patient admissions
Room	Stores hospital rooms
Treatment	Stores treatment given
Prescription	Stores medication prescriptions
Bill	Stores billing information
Nurse Assignment	Stores nurse assignments

```

121 bill_date DATE,
122 FOREIGN KEY (patientID) REFERENCES Patient(patientID),
123 FOREIGN KEY (admissionID) REFERENCES Admission(admissionID));
```

Relationships used:

- ✓ One department can have many doctors
- ✓ One department can have many nurses
- ✓ One patient can have many appointments
- ✓ One Dr can attend many appointments
- ✓ One patient can have many admissions circle
- ✓ One room can host many admissions over
- ✓ One patient can receive many treatments and prescriptions

Data insertion:

Sample hospital records were inserted into the table to simulate real-world hospital operations.

Major tables such as patient, appointment, admission, treatment and contain at least 20 records.

```

- ✓ A view named Patient appointment view was created to simplify the retrieval of appointment information by combining data from the patient doctor an appointment tables

Conclusion:

The Hospital management system database was successfully designed and implemented using Microsoft SQL server. Relational database concepts such as primary keys foreign keys joins and constraints and views were applied to model reward hospital operations effectively
